

Effective Wiki Search Strategy

Finding the Right Information for Your Task

Your Team Name

September 2026

Agenda

- 1 Introduction
- 2 The Dual Strategy
- 3 Step 1: Know Your Territory
- 4 Step 2: Explore the Universe
- 5 Step 3: Synthesize Information
- 6 Decision Logic
- 7 Conclusion
- 8 Q&A

The Challenge: Finding the Right Page

The Core Problem

How do we efficiently search for specific procedures (e.g., `pip setup`) on the Wiki?

- Many teams contribute to the Wiki.
- Information evolves over time.
- The **best** page is not always the **newest** page.
- We need to balance historical context (our team's past work) with recent updates (other teams).

Example Task

Setting up `pip` for bootstrapping and package installation.

The Search Strategy: A Dual Approach

1. Our Team's History

Historical Context

Know Our Pages
Review Past Solutions

2. Other Teams' Updates

Current Innovations

Find Recent Edits
Adapt to Changes

GOAL: SYNTHESIZE BOTH TO SELECT THE BEST PAGE AND UPDATE IT.

Step 1: Understanding "Our" Pages

- ➊ **Identify Servers/Projects:** Know which servers or projects belong to your team.
- ➋ **Filter by Ownership:** Use Wiki filters to show pages authored or primarily used by your team.
- ➌ **Find the "Last Time":** Locate the page your team used the last time this task was performed (e.g., last pip setup).

Why this matters

This ensures you understand the *baseline* and *terminology* your team is familiar with before looking at external changes.

Step 2: Searching the "Universal" Wiki

- **Broad Search:** Search for the specific task (e.g., "pip setup", "bootstrap packages").
- **Identify Creators:** Check *which team* created the page. Newer pages are often created by other teams working on modern architecture.
- **Review Timestamps:** Look for pages updated recently (e.g., within the last 2-6 months).

Key Insight

"Other teams have the latest pages." They might have solved a new dependency issue or changed a registry URL that we need to adopt.

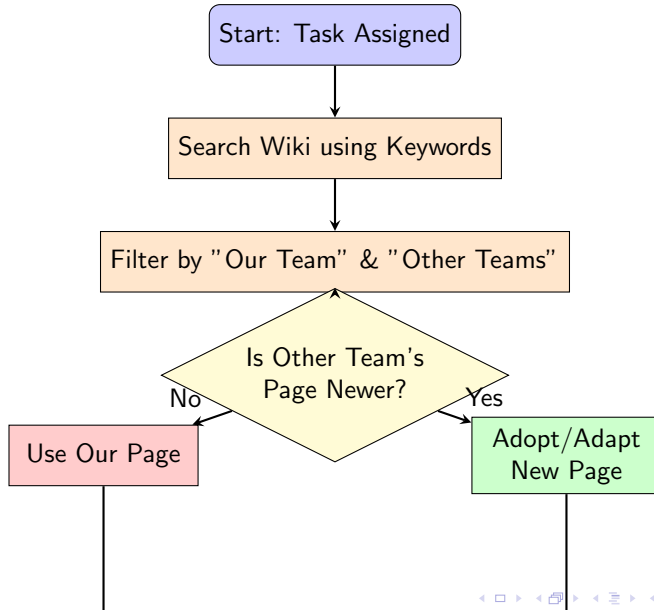

Step 3: Comparing and Selecting the Best Page

Criteria	Our Old Page	Other Team's New Page
Date Updated	2024	2026
Pip Version	20.x	24.x
Bootstrap Method	Manual	Automated Script
Known Issues	Outdated	Resolved

Table: Comparison Matrix

- 1 Identify the **core workflow** that remains the same.
- 2 Note the **new improvements** (e.g., new flags, new repositories).
- 3 Select the page that is **most accurate** for the current environment.

Decision Flowchart for Wiki Search

The Final Outcome: Updating the Wiki

The End Goal

Select the best page and put it on the wiki page.

- Consolidate the old workflow with the new changes.
- Ensure the page is **reusable** for future searches.
- Create a standard "How-To" for future team members.

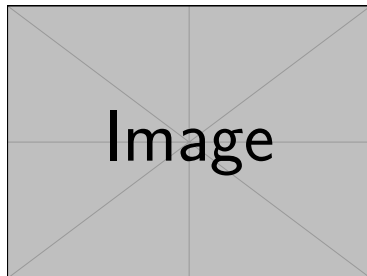

Remember

The search is not just about finding *any* page. It is about finding the *right* page that represents the collective knowledge of the organization.

Summary & Questions

Key Takeaways

- 1 Know your team's servers and pages.
- 2 Look at other teams' recent updates.
- 3 Compare the workflow and identify changes.
- 4 Select and refresh the best page.

Search. Compare. Update.
